Apache Directory Studio installed on dev-central

I installed Apache Directory Studio on dev-central.crbs.ucsd.edu primarily to allow us to import .ldif files when we are on wireless or at home. It required X to be operational on the server where it was installed. I also installed NX for speed. To run it, execute /usr/local/ApacheDirectoryStudio-linux-x86_64-1.4.0.v20090407/ApacheDirectoryStudio

It's setup to hit production LDAP. It will prompt you for the password when you try to connect. **Please, DO NOT SAVE THE PASSWORD!**
